View office utilisation in real time

Get a near time view of availability in your workplace so you can quickly see what spaces are available for use.

Quickly see what workspaces are occupied or available

Live view is a near real time traffic light system signalling whether or not each individual workplace asset is in use.

A red marker indicates that the asset is 'Occupied' and **a green marker** shows that it is 'Available'.

Mapped out against your floorplans, the feature will show the transition from occupied to available via an amber stage of **Recently Used.**

When the workstation has been vacated, after 2-5 minutes the status will show as **Recently Used**, for a customisable period, typically 30-45 minutes.

How Live view utilisation data can help manage offices reopening
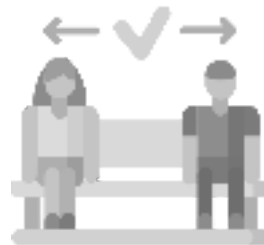

Active COVID deep cleaning
In the post COVID workplace, there will undoubtedly be an emphasis on cleaning.

Schedules for which will be supplemented with 'Active Cleaning' where cleaners will be present to disinfect workstations that have recently been used, rather than waiting for the end of the working day.

A near real time view of which workstations have recently been used but are not evidently occupied can help cleaners efficiently focus their efforts.

Social distancing
Employees will be expected to actively follow social distancing practises within the workplace.

The use of a near real time view can support this by helping them navigate to available workstations which are not directly opposite or adjacent to their colleagues.

Navigation
When desk sharing returns as a prominent feature of the workplace, employees will look for assistance in navigating to an available desk.

The 'Recently Used' marker is time bound and will indicate that a desk is still being held as in-use when someone has left for a short period of time and will return.

This eliminates the confusion caused by a desk quickly returning to an 'Available' state when someone has briefly got up, but left their belongings.
