CHALLENGES

- No understanding of how employees are interacting with recently refurbished office space
- High levels of lack of space complaints
- No data on current office occupancy and utilisation to support or deter complaints
- No way to establish desk ratio by teams and departments

SOLUTION

Occupancy & utilisation analytics software

Providing accurate anonymised data on how employees utilise and interact with different workspaces.

BENEFITS

1

Comparing departmental space utilisation

Better understanding of the needs of each department and what types of work settings they require more or less of to stay productive.

2

Shifting cultural and behavioural work practices

Better understanding of desk ratios allowed them to implement desk sharing practices to boost utilisation.

3

Improved space planning processes

Identifying trends and patterns of usage improved the understanding of what is in high or low demand, and where to make investments.

4

Reconfiguring asset types

Ability to target certain workspace assets to optimise utilisation based on high or low usage.
